

Axence nVision® AdminCenter

Your IT command and security center

AdminCenter is a completely new approach to IT monitoring that helps every administrator focus on a specific area and track only data of interest in one place.

With AdminCenter, you can build personalized dashboards to track key IT parameters and events on a single screen. You can create your own views for yourself, your team, and share them securely with other departments (such as HelpDesk operators, business) or with your supervisors via a password protected link.

- Create your own SOC – personalize dashboards
- Gain corporate network visibility
- Monitor key parameters and events on your IT network
- Display clear graphs, tables, and indicators
- Use large TV screens or slide projectors
- Easily share views with selected groups

Axence nVision® is an essential tool for any IT department to monitor the network and users, take inventories of hardware and software, provide remote support and protect data leakage. It also allows management boards to optimize the costs of an IT infrastructure of any size, and supports organizations in complying with legal requirements and safety standards.

Use available widgets, such as:

- performance of selected devices on the network
 - changes in hardware and software configuration
 - load on the links
 - operations on files, disks, and storage devices
 - events on corporate assets
 - websites visited and applications used by users
 - new or expired HelpDesk tickets
 - team and employee activity indicators
- ...and many more parameters depending on the Axence nVision® modules you have.
